## MicroPOWER INSTRUMENTATION AMPLIFIER

## FEATURES

- LOW QUIESCENT CURRENT: $175 \mu \mathrm{~A}$
- WIDE SUPPLY RANGE: $\pm 1.35 \mathrm{~V}$ to $\pm 18 \mathrm{~V}$
- LOW OFFSET VOLTAGE: $250 \mu \mathrm{~V}$ max
- LOW OFFSET DRIFT: $3 \mu \mathrm{~V} /{ }^{\circ} \mathrm{C}$ max
- LOW NOISE: $35 n \mathrm{~V} / \sqrt{\mathrm{HZ}}$
- LOW INPUT BIAS CURRENT: 25nA max
- 8-PIN DIP, SO-8, MSOP-8 SURFACE- MOUNT PACKAGES

## APPLICATIONS

- INDUSTRIAL SENSOR AMPLIFIER:

Bridge, RTD, Thermocouple

- PHYSIOLOGICAL AMPLIFIER: ECG, EEG, EMG
- MULTI-CHANNEL DATA ACQUISITION
- PORTABLE, BATTERY OPERATED SYSTEMS

## DESCRIPTION

The INA126 is a precision instrumentation amplifier for accurate, low noise differential signal acquisition. Its two-op-amp design provides excellent performance with very low quiescent current $(175 \mu \mathrm{~A})$. This, combined with its wide operating voltage range of $\pm 1.35 \mathrm{~V}$ to $\pm 18 \mathrm{~V}$, makes it ideal for portable instrumentation and data acquisition systems.
Gain can be set from 5V/V to $10000 \mathrm{~V} / \mathrm{V}$ with a single external resistor. Laser trimmed input circuitry provides low offset voltage ( $250 \mu \mathrm{~V}$ max), low offset voltage drift $\left(3 \mu \mathrm{~V} /{ }^{\circ} \mathrm{C}\right.$ max) and excellent commonmode rejection.

Package options include 8-pin plastic DIP, SO-8 surface mount, and fine-pitch MSOP-8 surface-mount. All are specified for the $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ industrial temperature range.

## PIN CONFIGURATION

## ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Burr-Brown recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.
ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## APPLICATION INFORMATION

Figure 1 shows the basic connections required for operation of the INA126. Applications with noisy or high impedance power supplies may require decoupling capacitors close to the device pins as shown.
The output is referred to the output reference (Ref) terminal which is normally grounded. This must be a low-impedance connection to ensure good common-mode rejection. A resistance of $8 \Omega$ in series with the Ref pin will cause a typical device to degrade to approximately 80 dB CMR.

## SETTING THE GAIN

Gain of the INA126 is set by connecting a single external resistor, $\mathrm{R}_{\mathrm{G}}$, as shown:

$$
\begin{equation*}
\mathrm{G}=5+\frac{80 \mathrm{k} \Omega}{\mathrm{R}_{\mathrm{G}}} \tag{1}
\end{equation*}
$$

Commonly used gains and $\mathrm{R}_{\mathrm{G}}$ resistor values are shown in Figure 1.
The $80 \mathrm{k} \Omega$ term in equation 1 comes from the internal metal film resistors which are laser trimmed to accurate absolute values. The accuracy and temperature coefficient of these resistors are included in the gain accuracy and drift specifications of the INA126.

The stability and temperature drift of the external gain setting resistor, $\mathrm{R}_{\mathrm{G}}$, also affects gain. $\mathrm{R}_{\mathrm{G}}$ 's contribution to gain accuracy and drift can be directly inferred from the gain equation (1). Low resistor values required for high gain can
make wiring resistance important. Sockets add to the wiring resistance, which will contribute additional gain error in gains of approximately 100 or greater.

## OFFSET TRIMMING

The INA126 is laser trimmed for low offset voltage and offset voltage drift. Most applications require no external offset adjustment. Figure 2 shows an optional circuit for trimming the output offset voltage. The voltage applied to the Ref terminal is added to the output signal. An op amp buffer is used to provide low impedance at the Ref terminal to preserve good common-mode rejection.

FIGURE 2. Optional Trimming of Output Offset Voltage.

FIGURE 1. Basic Connections.

## INPUT BIAS CURRENT RETURN

The input impedance of the INA126 is extremely highapproximately $10^{9} \Omega$. However, a path must be provided for the input bias current of both inputs. This input bias current is typically -10 nA (current flows out of the input terminals). High input impedance means that this input bias current changes very little with varying input voltage.
Input circuitry must provide a path for this input bias current for proper operation. Figure 3 shows various provisions for an input bias current path. Without a bias current path, the inputs will float to a potential which exceeds the commonmode range of the INA126 and the input amplifiers will saturate.

If the differential source resistance is low, the bias current return path can be connected to one input (see the thermocouple example in Figure 3). With higher source impedance, using two equal resistors provides a balanced input with advantages of lower input offset voltage due to bias current and better high-frequency common-mode rejection.

FIGURE 3. Providing an Input Common-Mode Current Path.

## INPUT COMMON-MODE RANGE

The input common-mode range of the INA126 is shown in typical performance curves. The common-mode range is limited on the negative side by the output voltage swing of $\mathrm{A}_{2}$, an internal circuit node that cannot be measured on an external pin. The output voltage of $\mathrm{A}_{2}$ can be expressed as:

$$
\begin{equation*}
\mathrm{V}_{\mathrm{O} 2}=1.25 \mathrm{~V}_{\mathrm{IN}}^{-}-\left(\mathrm{V}_{\mathrm{IN}}^{+}-\mathrm{V}_{\mathrm{IN}}^{-}\right)\left(10 \mathrm{k} \Omega / \mathrm{R}_{\mathrm{G}}\right) \tag{2}
\end{equation*}
$$

(Voltages referred to Ref terminal, pin 5)
The internal op amp $A_{2}$ is identical to $A_{1}$ and its output swing is limited to typically 0.7 V from the supply rails. When the input common-mode range is exceeded ( $\mathrm{A}_{2}$ 's output is saturated), $\mathrm{A}_{1}$ can still be in linear operation and respond to changes in the non-inverting input voltage. The output voltage, however, will be invalid.

## LOW VOLTAGE OPERATION

The INA126 can be operated on power supplies as low as $\pm 1.35 \mathrm{~V}$. Performance remains excellent with power supplies ranging from $\pm 1.35 \mathrm{~V}$ to $\pm 18 \mathrm{~V}$. Most parameters vary only slightly throughout this supply voltage range-see typical performance curves. Operation at very low supply voltage requires careful attention to ensure that the common-mode voltage remains within its linear range. See "Input Com-mon-Mode Voltage Range."
The INA126 can be operated from a single power supply with careful attention to input common-mode range, output voltage swing of both op amps and the voltage applied to the Ref terminal. Figure 4 shows a bridge amplifier circuit operated from a single +5 V power supply. The bridge provides an input common-mode voltage near 2.5 V , with a relatively small differential voltage.

## INPUT PROTECTION

The inputs of the INA126 are protected with internal diodes connected to the power supply rails. These diodes will clamp the applied signal to prevent it from exceeding the power supplies by more than approximately 0.7 V . If the signal source voltage can exceed the power supplies, the source current should be limited to less than 10 mA . This can generally be done with a series resistor. Some signal sources are inherently current-limited and do not require limiting resistors
